SUMMARY

Agentic AI Engineer and Python Developer pursuing a Master's degree, with hands-on experience designing and building scalable agentic AI systems, multi-agent workflows, retrieval-augmented generation (RAG) pipelines, and AI-powered automation tools. Experienced in developing agentic applications and scalable backend services using Python, FastAPI, LangGraph, LangChain, LangSmith, vector databases, and leading LLM APIs. I prototype fast with AI-assisted tools, iterate based on real usage, and focus on tools that automate workflows and save measurable time.

EDUCATION

Master of Computer Applications (MCA)

Gujarat Vidyapith

2025 – 2027 (Expected)

Ahmedabad, Gujarat

Bachelor of Computer Applications (BCA)

Smt. B.K. Mehta IT Centre BCA College Palanpur

2022 – 2025

Palanpur, Gujarat

TECHNICAL SKILLS

Languages: Python, Java, C, C++, HTML, CSS, JavaScript, SQL, PHP

AI & LLMs: LLM APIs Integration, LangGraph, LangChain, RAG Pipelines, Prompt Engineering, Observability, LLM Evals, Agentic Workflows, MCP

Frameworks & Tools: FastAPI, Flask, Streamlit, React (basic), REST APIs, Django, Pydantic

Libraries: Pandas, NumPy, SpaCy, NLTK, Scikit-Learn, HuggingFace Transformers

Databases: PostgreSQL, MySQL, Qdrant, FAISS, ChromaDB, Opensearch

Developer Tools: Git, GitHub, LangSmith, VS Code, Docker, Google Colab, Antigravity

PROJECTS

OpsPilot — Autonomous RevOps AI Agent Platform | [Demo](#)

- **Tech Stack:** Python, FastAPI, LangGraph, LangChain, Google Gemini, React (Vite + Tailwind CSS), ChromaDB, SQLAlchemy, LangSmith, Slack SDK, Notion API, Salesforce API, SSE.
- Architected an autonomous ReAct AI agent using LangGraph and LangChain, enabling Google Gemini to dynamically reason, invoke tools, query Salesforce CRM, retrieve knowledge from Notion via its API using ChromaDB-powered RAG, and automate CRM task creation.
- Built a real-time, event-driven platform by integrating Slack Socket Mode with a FastAPI backend and React dashboard using Server-Sent Events (SSE), delivering live AI workflows, analytics, and execution monitoring.
- Developed a Human-in-the-Loop (HITL) approval system allowing operators to review, edit, and approve AI-generated responses before publishing to Slack, improving control and reliability.
- Implemented telemetry for token usage, latency, and cost tracking, along with interactive dashboards for ROI, automation metrics, and custom date-based analytics.

ResearchFlow — Autonomous Deep Research Agent | [Live App](#)

- **Tech Stack:** Python, LangGraph, Gemini LLM, Streamlit, LangSmith.
- Designed and engineered ResearchFlow, an autonomous deep research agent powered by LangGraph and Gemini LLM.
- The system orchestrates an iterative self-correction research loop that evaluates gathered evidence and refines search queries dynamically.

- Additionally, it implements a concurrent claim-level verification pipeline that fact-checks generated findings against live web sources.
- Designed a persistent Streamlit dashboard, and integrated LangSmith to enable comprehensive observability and tracing of complex multi-agent graphs.

AI Event Scout Agent

- **Tech Stack:** Python, FastAPI, LangGraph, Streamlit UI, Gemini API
- Built an autonomous multi-agent system that discovers, validates, deduplicates, and ranks AI events from the web, replacing a fully manual research process.
- Designed agent workflows covering web search, scraping, structured extraction, and duplicate detection; exposed as a FastAPI service for integration with downstream tools.
- Implemented configurable pipelines for rapid iteration; the modular architecture allowed new data sources to be added in under 30 minutes.

Dynamic Filter System | *FastAPI, PostgreSQL, JavaScript*

- Built a production-ready FastAPI backend for enterprise datasets supporting dynamic filtering, sorting, pagination, and multi-attribute querying via REST APIs.
- Optimized PostgreSQL queries through indexing and efficient SQL execution, improving API response times for large datasets.
